

Coding Challenge: Hospital Management System

- Project submissions should be done through the partcipants' Github repository and the link should be shared with trainers and Hexavarsity.
- Follow object-oriented principles throughout the project. Use classes and objects to model real-world entities, encapsulate data and behavior, and ensure code reusability.
- Throw user defined exceptions from corresponding methods and handled.
- The following Directory structure is to be followed in the application.
 - entity
 - Create entity classes in this package. All entity class should not have any business logic.
 - o dao
- Create Service Provider interface to showcase functionalities.
- Create the implementation class for the above interface with db interaction.
- exception
 - Create user defined exceptions in this package and handle exceptions whenever needed.
- o util
- Create a DBPropertyUtil class with a static function which takes property file name as parameter and returns connection string.
- Create a DBConnUtil class which holds static method which takes connection string as parameter file and returns connection object(Use method defined in DBPropertyUtil class to get the connection String).
- o main
 - Create a class MainModule and demonstrate the functionalities in a menu driven application.

Problem Statement:

1Create SQL Schema from the following classes class, use the class attributes for table column names.

- 1. Create the following **model/entity classes** within package **entity** with variables declared private, constructors(default and parametrized,getters,setters and toString())
- 1. Define **`Patient`** class with the following confidential attributes:
 - a. patientId
 - b. firstName
 - c. lastName;
 - d. dateOfBirth
 - e. gender
 - f. contactNumber

- g. address;
- **2.** Define **'Doctor**' class with the following confidential attributes:
 - a. doctorId
 - b. firstName
 - c. lastName
 - d. specialization
 - e. contactNumber;

3. Appointment Class:

- a. appointmentId
- b. patientId
- c. doctorId
- d. appointmentDate
- e. description
- 2. Implement the following for all model classes. Write default constructors and overload the constructor with parameters, getters and setters, method to print all the member variables and values.
- 3. Define **IHospitalService** interface/abstract class with following methods to interact with database

Keep the interfaces and implementation classes in package dao

- a. getAppointmentById()
 - i. Parameters: appointmentId
 - ii. ReturnType: Appointment object
- b. getAppointmentsForPatient()
 - i. Parameters: patientId
 - ii. ReturnType: List of Appointment objects
- c. getAppointmentsForDoctor()
 - i. Parameters: doctorId
 - ii. ReturnType: List of Appointment objects
- d. scheduleAppointment()
 - i. Parameters: Appointment Object
 - ii. ReturnType: Boolean
- e. updateAppointment()
 - i. Parameters: Appointment Object
 - ii. ReturnType: Boolean

f. ancelAppointment()

i. Parameters: AppointmentId

ii. ReturnType: Boolean

- 6. Define HospitalServiceImpl class and implement all the methods IHospitalServiceImpl.
- 7. Create a utility class **DBConnection** in a package **util** with a static variable **connection** of Type **Connection** and a static method **getConnection()** which returns connection.

Connection properties supplied in the connection string should be read from a property file.

Create a utility class **PropertyUtil** which contains a static method named **getPropertyString()** which reads a property fie containing connection details like hostname, dbname, username, password, port number and returns a connection string.

- 8. Create the exceptions in package myexceptions

 Define the following custom exceptions and throw them in methods whenever needed. Handle all the exceptions in main method,
 - 1. **PatientNumberNotFoundException** :throw this exception when user enters an invalid patient number which doesn't exist in db
- 9. Create class named MainModule with main method in package mainmod.

Trigger all the methods in service implementation class.
